Swiss Association for Animal Sciences
01/06/2020

Why AMR in Animals ?

Antimicrobial Use in Animals – Global Trends

Version 1, 2010: Van Boeckel et al 2015, PNAS.
Version 2, 2013: Van Boeckel et al 2017, Science.
Version 3, 2017: Tiseo et al 2020, Antibiotics.

Antimicrobial Use in Animals – Switzerland (2017)

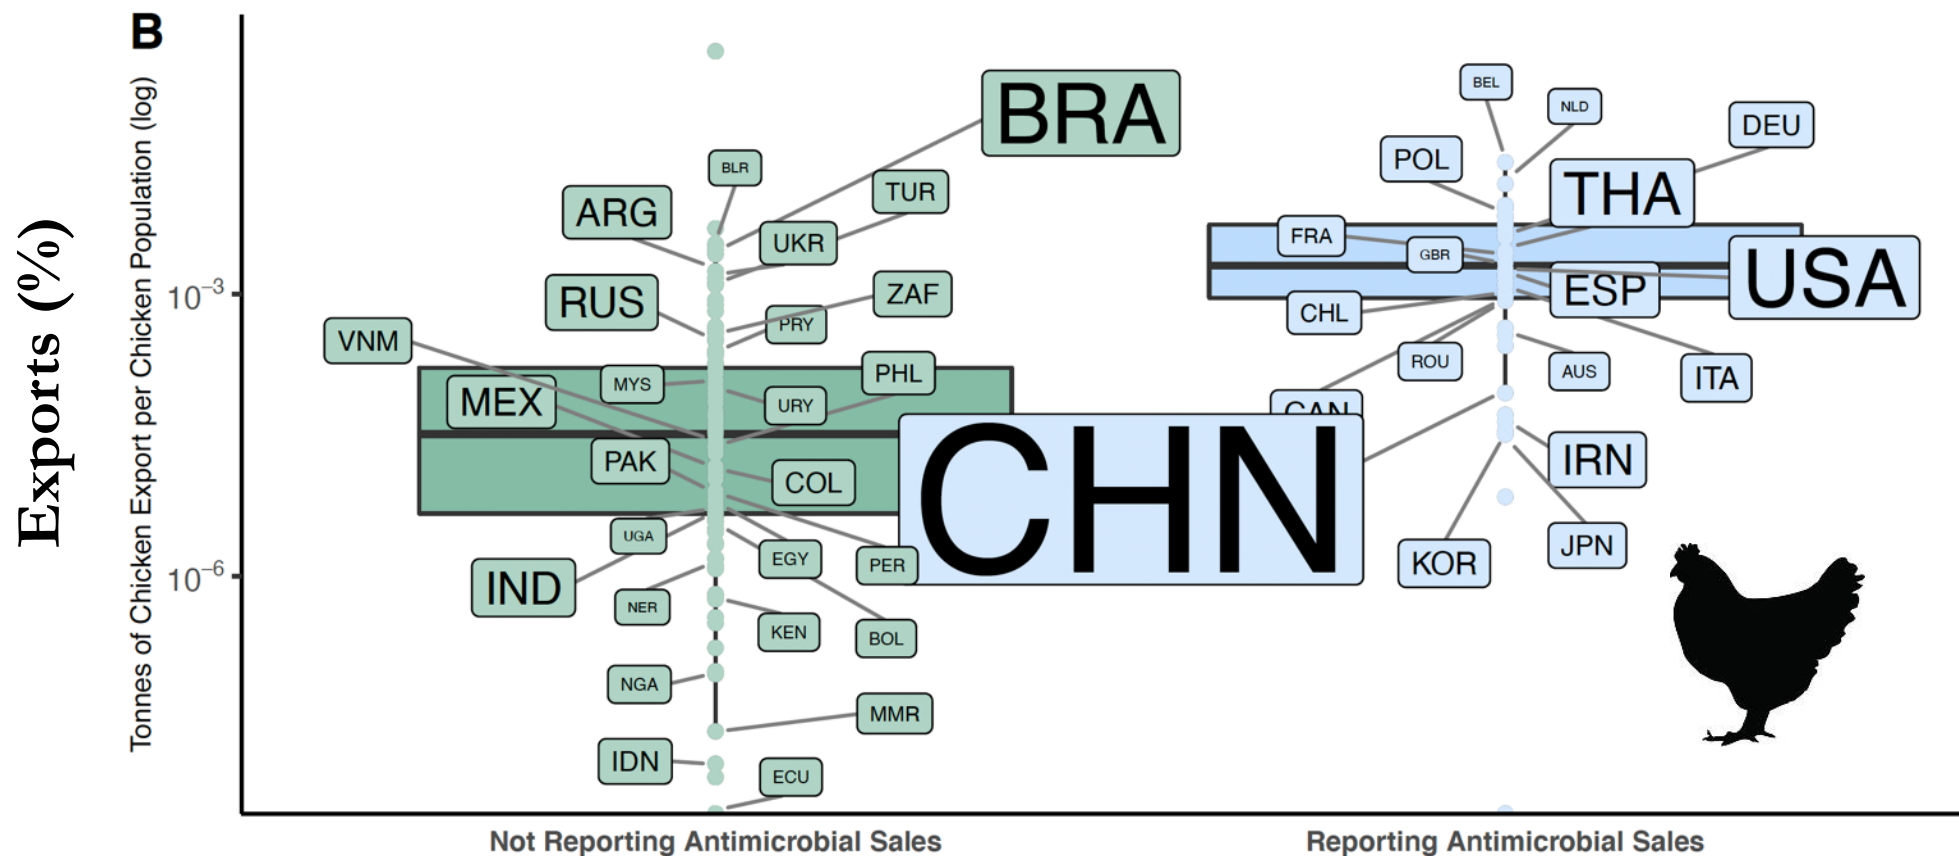

Fig. 1.4 : Ventes totales d'antibiotiques par PCU dans les années 2010 à 2019

Antimicrobial Use in Animals - Meat Exports

Countries that reported antimicrobial sales also **exported a higher proportion of their meat** production (chicken) than countries that did not report antimicrobial sales. A notable **exception** was one of the largest meat exporter the world: **Brazil**.

Antimicrobial Resistance in Animals

(low and middle-income countries)

Why a map of AMR for low- and middle-income countries?

High-Income countries

vs

Low- and Middle-Income Countries

Systematic Surveillance (NARMS, ESVAC, etc)
Publically available information

Interventions

Rapid growth of the livestock sector

Systematic Surveillance
nascent or absent : 1, 2, 5 years..?

Intervention guided by expert opinion.

Problem: the AMR situation in LMICs if not intuitive

Low-Meat consumption
Low access to drugs

→ **AMR levels are low**

Unregulated Antimicrobial Use

Low Biosecurity → **AMR levels are high**

What we need :

In the short term, we need an alternative to systematic surveillance for animals in LMICs.

Point Prevalence Surveys of AMR in Animals

Have been conducted for decades by veterinarians and represent a largely untapped source of information to provide geographical perspective of the world's AMR situation in animals.

Antimicrobial wild type distributions of microorganisms

- [Search database](#)

MIC- and inhibition zone diameter distributions of microorganisms without and with resistance mechanisms

MIC distributions

The website gives MIC distributions for individual organisms and antimicrobial agents in tables and histograms. The distributions are based on collated data from an increasing total of more than 20000 MIC distributions from worldwide sources. Unless otherwise specifically stated, the data are representative of results obtained with a variety of MIC methods. Different methods do not give exactly the same results but the results rarely vary by more than one doubling dilution step. In this way the aggregated MIC distributions encompass the variation between different investigators and between different methods.

Stacking with Universal Kriging

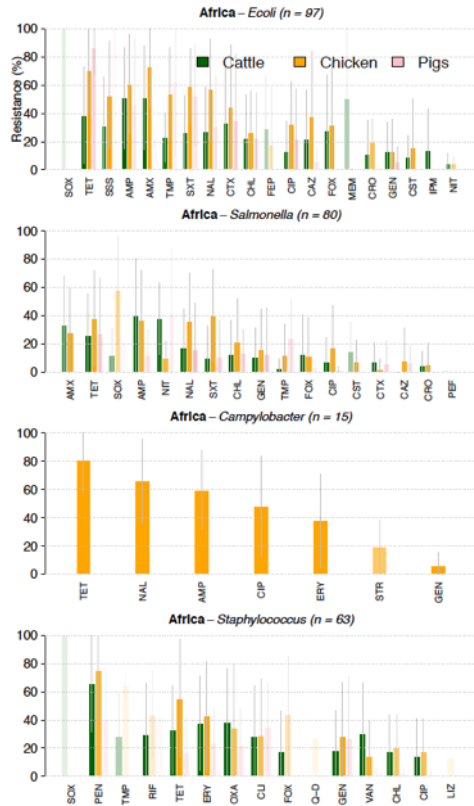

$$\begin{aligned} Cov_1 &= P_{\text{Boosted Regression Trees}} \\ Cov_2 &= P_{\text{Generalized Additive Model}} \\ Cov_3 &= P_{\text{LASSO Regression}} \end{aligned}$$

Hotspots of Antimicrobial Resistance in Animals

AMR per Drug/Pathogens Combinations

In LMICS, the highest resistance rates are associated with the most commonly used veterinary drugs
Tetracyclines, Sulfonamides, penicillin

In LMICs, medically important antimicrobials
Variations between animals species
Ciprofloxacin & Erythromycin (20-60%)
3rd and 4th Gen. Cephalosporins (10-40%)
Gentamicin (5-38%)
Carbapenems (<5%)

	Quinolones	Gentamicin
LMICs vs	20-60%.	5-38%
EU vs	60-64%.	2.4-8.9%
US.	2.4-4.6%.	2-41%

Aquaculture

Production volumes from cultured fish has overtaken wild fisheries, and is growing faster terrestrial livestock as a source of animals protein.

Aquaculture

Vaccinating salmon: How Norway avoids antibiotics in fish farming

October 2015

Norway has cut antibiotic use in salmon—one of the principal foods consumed in the country and a major export—to virtually zero. This has led to a flourishing industry and a reduction in the risk of antibiotic resistance in humans.

Aeromonas salmonicida
furunculosis

Figure 3. Relative country-level exposure to antimicrobial resistance in chickens, pigs and cattle. This metric quantifies the exposure levels of the animal populations. The analysis was restricted to countries with at least 10 million chicken, 250,000 pigs, and 500,000 cattle heads.

Campylobacter (n_s = 12, n_i = 789)

E. coli (n_s = 141, n_i = 10,409)

S. aureus (n_s = 101, n_i = 9,225)

Salmonella (n_s = 71, n_i = 1,612)

Figure 4. Resistance rates, number of surveys (n_s) and total number of isolates tested (n_i) by pathogen listed by the AGISAR consortium. See protocol SI in Van Boeckel & Pires, *Science* 365, (2019).

Disclaimer

The information in this country-report result from the aggregation, and extrapolation of data from surveys conducted by independent scientists. It does not reflect the official positions of a country's veterinary authorities on its antimicrobial resistance levels in animals. The detailed methodology and data source for this country-report are presented in Van Boeckel & Pires, 2019.
