

Genomische Zuchtwertschätzung: Wer macht was?

C. Stricker

stricker@genetics-network.ch
agn Genetics GmbH, Davos

Ablauf

- ▶ Einleitung, Was ist genomische ZWS, Christian Stricker, agn Genetics GmbH
- ▶ Modellierung von Haplotypen, Christian Stricker, agn Genetics GmbH
- ▶ Aktuelle Arbeiten zur genomischen Selektion bei Qualitas. Birgit Gredler, Qualitas AG, Zug
- ▶ Projektstand genomische ZWS beim Schwein. Andreas Hofer, SUISAG, Sempach
- ▶ Genomweite Assoziationsstudien in verschiedenen Rassen/Spezies. Christine Flury, HAFL, Zollikofen

Quick Reminder of Genomic Prediction

- ▶ 1k,... >>100k SNP typisiert
- ▶ 1k, <100k Tiere
- ▶ Meuwissen et al. (2001): Marker Effects Model

$$\mathbf{y} = \mathbf{X}\boldsymbol{\beta} + \mathbf{Z}\boldsymbol{\alpha} + \mathbf{e} \quad (1)$$

- ▶ \mathbf{y} vector of trait phenotypes
 - ▶ \mathbf{X} incidence matrix relating non-genetic, fixed effects $\boldsymbol{\beta}$ to \mathbf{y}
 - ▶ \mathbf{Z} matrix of SNP genotype covariates,
 - ▶ $\boldsymbol{\alpha}$ vector of random, partial-regression coefficients for SNPs
 - ▶ \mathbf{e} is vector of residuals
- ▶ Bayesian alphabet is based on this model
 - ▶ can show that BayesC $\pi=0$ is GBLUP (see below)

Quick Reminder of Genomic Prediction

- ▶ 1k,... >>100k SNP typisiert
- ▶ 1k, <100k Tiere
- ▶ Meuwissen et al. (2001): Marker Effects Model

$$\mathbf{y} = \mathbf{X}\boldsymbol{\beta} + \mathbf{Z}\boldsymbol{\alpha} + \mathbf{e} \quad (1)$$

- ▶ \mathbf{y} vector of trait phenotypes
 - ▶ \mathbf{X} incidence matrix relating non-genetic, fixed effects $\boldsymbol{\beta}$ to \mathbf{y}
 - ▶ \mathbf{Z} matrix of SNP genotype covariates,
 - ▶ $\boldsymbol{\alpha}$ vector of random, partial-regression coefficients for SNPs
 - ▶ \mathbf{e} is vector of residuals
- ▶ Bayesian alphabet is based on this model
 - ▶ can show that BayesC $\pi=0$ is GBLUP (see below)

Quick Reminder of Genomic Prediction

- ▶ 1k,... >>100k SNP typisiert

 - ▶ \mathbf{e} is vector of residuals
- ▶ Bayesian alphabet is based on this model
 - ▶ can show that BayesC $\pi=0$ is GBLUP (see below)

Quick Reminder of Genomic Prediction, cont.

- ▶ Nejati-Javaremi et al. (1997): Animal Effect Model

$$\mathbf{y} = \mathbf{X}\boldsymbol{\beta} + \mathbf{Z}\mathbf{u} + \mathbf{e} \quad (2)$$

- ▶ \mathbf{y} , $\mathbf{X}\boldsymbol{\beta}$, \mathbf{e} as above in model (1)
- ▶ \mathbf{Z} incidence matrix relating animal effects to \mathbf{y} ,
- ▶ \mathbf{u} vector of random animal effects
- ▶ Solutions usually by MMEs
- ▶ use $\mathbf{G} = \mathbf{Z}\mathbf{Z}'/2\sum pq$ instead of \mathbf{A}
- ▶ requires \mathbf{G}^{-1} (instead of \mathbf{A}^{-1})
- ▶ \mathbf{G} is dense, cannot be inverted, when $>50k$ animals genotyped....
- ▶ Legarra et al. (2009), Christensen & Lund (2010) combined \mathbf{A} for ungenotyped animals with \mathbf{G} for genotyped animals
- ▶ requires \mathbf{G}^{-1} and \mathbf{A}_{22}^{-1} , dense and not easy!
- ▶ need alternatives when $> 50k$ animals genotyped

Quick Reminder of Genomic Prediction, cont.

- ▶ Nejadi-Javaremi et al. (1997): Animal Effect Model

$$\mathbf{y} = \mathbf{X}\boldsymbol{\beta} + \mathbf{Z}\mathbf{u} + \mathbf{e} \quad (2)$$

- ▶ \mathbf{y} , $\mathbf{X}\boldsymbol{\beta}$, \mathbf{e} as above in model (1)
 - ▶ \mathbf{Z} incidence matrix relating animal effects to \mathbf{y} ,
 - ▶ \mathbf{u} vector of random animal effects
- ▶ Solutions usually by MMEs
- ▶ use $\mathbf{G} = \mathbf{Z}\mathbf{Z}'/2\sum pq$ instead of \mathbf{A}
- ▶ requires \mathbf{G}^{-1} (instead of \mathbf{A}^{-1})
- ▶ \mathbf{G} is dense, cannot be inverted, when $>50k$ animals genotyped....
- ▶ Legarra et al. (2009), Christensen & Lund (2010) combined \mathbf{A} for ungenotyped animals with \mathbf{G} for genotyped animals
- ▶ requires \mathbf{G}^{-1} and \mathbf{A}_{22}^{-1} , dense and not easy!
- ▶ need alternatives when $> 50k$ animals genotyped

Quick Reminder of Genomic Prediction, cont.

- ▶ Nejati-Javaremi et al. (1997): Animal Effect Model

$$\mathbf{y} = \mathbf{X}\boldsymbol{\beta} + \mathbf{Z}\mathbf{u} + \mathbf{e} \quad (2)$$

- ▶ \mathbf{y} , $\mathbf{X}\boldsymbol{\beta}$, \mathbf{e} as above in model (1)
- ▶ \mathbf{Z} incidence matrix relating animal effects to \mathbf{y} ,
- ▶ \mathbf{u} vector of random animal effects
- ▶ Solutions usually by MMEs
- ▶ use $\mathbf{G} = \mathbf{Z}\mathbf{Z}'/2\sum pq$ instead of \mathbf{A}
- ▶ requires \mathbf{G}^{-1} (instead of \mathbf{A}^{-1})
- ▶ \mathbf{G} is dense, cannot be inverted, when $>50k$ animals genotyped....
- ▶ Legarra et al. (2009), Christensen & Lund (2010) combined \mathbf{A} for ungenotyped animals with \mathbf{G} for genotyped animals
- ▶ requires \mathbf{G}^{-1} and \mathbf{A}_{22}^{-1} , dense and not easy!
- ▶ need alternatives when $> 50k$ animals genotyped

Quick Reminder of Genomic Prediction, cont.

- ▶ Nejati-Javaremi et al. (1997): Animal Effect Model

$$\mathbf{y} = \mathbf{X}\boldsymbol{\beta} + \mathbf{Z}\mathbf{u} + \mathbf{e} \quad (2)$$

- ▶ \mathbf{y} , $\mathbf{X}\boldsymbol{\beta}$, \mathbf{e} as above in model (1)
 - ▶ \mathbf{Z} incidence matrix relating animal effects to \mathbf{y} ,
 - ▶ \mathbf{u} vector of random animal effects

Problems of Genomic Prediction

- ▶ Anzahl Tiere $\gg 50'000$
 - ▶ MEM anwendbar, aber MCMC CPU-intensiv!
 - ▶ AEM unmöglich, wegen \mathbf{G}^{-1}
 - ▶ AEM ohne $\mathbf{G}^{-1} \Rightarrow$ Forschungsprojekt Fernando & Garrick (2013/14)
- ▶ Anzahl SNPs $\gg 50'000$
 - ▶ Genauigkeit aufgrund LD \rightarrow ermöglicht across breed evaluation
 - ▶ SNP Arrays mit Markern in LD = redundante Info analysieren
 - ▶ Imputation = redundante Info auf nicht typisierte Tiere übertragen, damit bestehende Software genutzt werden kann
 - ▶ variable reduction methods (Bayes B) oder Konzentration der Markerinfo auf segregierende Haplotypen

Genomic Prediction with Haplotypes

- ▶ Definition einer Segmentgrösse
- ▶ Phasing des Segments basierend auf Ansatz von Kong et al. (Surrogacy, genetic distance measure)
- ▶ Identifikation der Anzahl segregierender Haplotypen je Chromosomensegment
- ▶ Tausende von SNPs korrespondieren zu wenigen Haplotypen
- ▶ Haplotypen bei Tiere mit versch. dichten Typisierungen identifizierbar
- ▶ keine Imputation (Imputation generiert keine neue Information!)
- ▶ Genomische ZWS mit Haplotypen = Data Reduktion und Imputation in einem Schritt.
- ▶ beliebige Anzahl SNPs analysierbar
- ▶ MEM oder AEM

Genomic Prediction with Haplotypes

- ▶ Definition einer Segmentgrösse
- ▶ Phasing des Segments basierend auf Ansatz von Kong et al. (Surrogacy, genetic distance measure)
- ▶ Identifikation der Anzahl segregierender Haplotypen je Chromosomensegment
- ▶ Tausende von SNPs korrespondieren zu wenigen Haplotypen
- ▶ Haplotypen bei Tiere mit versch. dichten Typisierungen identifizierbar
- ▶ keine Imputation (Imputation generiert keine neue Information!)
- ▶ Genomische ZWS mit Haplotypen = Data Reduktion und Imputation in einem Schritt.
- ▶ beliebige Anzahl SNPs analysierbar
